

Turnkey Authentication Solution To Protect Your Users and Business

Validating Genuine Users Just Got Easier

Vonage patented two-factor authentication (2FA) technology helps you protect against fraud and build trust across multiple channels — no telecom or security experience required. Verify API delivers code and optimizes multiple parameters to maximize user conversions, and it can be up and running within hours. Plus, you'll only pay for successful verifications.

Verify any user, anywhere

Multichannel authentication

Streamline the user experience without sacrificing security by using six verification channels: SMS, RCS, voice (text-to-speech), WhatsApp, email, and Silent Authentication.

Custom failover sequence

Enjoy more flexibility and control by allowing customers to customize the automatic retry and failover process for the channel best suited for your users.

Silent Authentication

Validate users, without any input, in seconds through their mobile network. Having no passcode eliminates the risk of social engineering attacks and reduces SMS traffic pumping fraud. This boosts the speed, simplicity, and security for user verifications.

Branded and trusted

Leverage RCS features to deliver a fully branded, secure, and trusted authentication experience.

Custom templates

Customize message templates, pre-record voice calls, and configure the time between retries.

Full-Service 2FA API

Enhance the customer journey with:

Customer onboarding

Make sure real humans create new accounts by deploying 2FA during the sign-up process.

User verifications

Ensure that end users verify large or important transactions in real time.

Password resets and account changes

Validate that password resets and account changes are authentic to prevent account takeover by fraudsters.

Bring-your-own-PIN

Add an extra layer of comfort. For security- and privacy-conscious businesses, Verify allows customers to generate and manage their own PIN code.

Toll fraud prevention

Detect and block toll fraud automatically with Verify using Smart Network blocks. Restore on your own using Network Unblock API.

Callbacks

Configure Webhooks to receive summary callbacks related to Verify API requests and network blocks.

Global reach and compliance

Increase your addressable market with the ability to verify and acquire customers globally. Verify is customizable to local preferences and adheres to foreign regulations.

Lower, predictable costs and risk

Select a flexible pricing model to fit your needs — and only pay per successful verification.

Customer spotlight: Lydia Solutions

Lydia Solutions is one of the fastest-growing mobile financial services platforms in Europe. Thanks to Vonage Verify API and Silent Authentication, the company enhanced its security and customer experience.

In fact, Lydia Solutions has protected the data and privacy of tens of thousands of users daily, and experienced improved customer conversion rates — setting a new standard for secure, effortless authentication. This includes a near-50% reduction in latency compared to previous authentication services.

"Vonage Verify with Silent Authentication has been a real innovation for us. The solution has elevated our ability to deliver a simpler, seamless, and more secure user experience while protecting against increasingly sophisticated threats and fraud patterns."

William Brulin
